

2014 年 12 月六级作文范文：科技对学习是否重要

北京新东方四六级团队 刘杨

We can see a teacher and a student in the cartoon above. When the teacher asks the student to answer a question written on the blackboard, the student wants to seek tech support rather than work it out by himself. The picture aims to tell us the problem that young students are highly dependent on high technology, overlooking the importance of independent thinking.

A large number of people point out that technology has played an irreplaceable part in learning process, while many others are against it. Those in favor of high technology believe we have benefited a lot from the convenience brought by Information Technology. For instance, our work efficiency has improved because computers can do complex calculations faster and more accurately than men. Also, the Internet has made it much easier to get access to information than before. However, many people claim that over-dependence on technology has done more harm than good.

As one of youngsters, I think as long as we can take advantages of hi-tech reasonably, our learning process will be highly beneficial. At the same time, keep it in mind that independent thinking comes first, while tech support just offers assistance. Only in this way, can we benefit most from our learning process.
